Drug Bag Tracker

Preparing drug bag labels, usage logs, controlled drugs registers and drug matrices

Guide for	**Anyone preparing or checking a drug bag, a CD safe or a formulary**
Made by	**Finlay Russell — finlay3110@gmail.com**
Licence	**MIT — provided as is, with no warranty**

Before you use anything this produces. This tool formats what you type. It does not check it. You are responsible for verifying every entry — name, formulation, strength, batch, expiry, quantity and legal category — against the stock actually held, and against your own medicines policy, before a document goes into service.

1. What it does

Drug Bag Tracker turns a list of what you hold into printable A4 paperwork. It makes three separate documents:

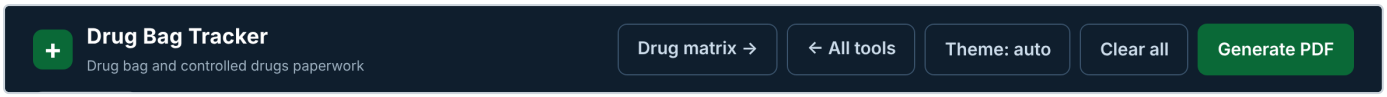

- **A drug bag** — a contents label for the outside of the bag, then a numbered usage log for every medication so each dose can be signed out.
- **A controlled drugs register** — a front sheet for the safe, a running-balance register page for each drug, a stock check record, and a sign-out sheet for stock taken from the safe into a personal pouch.
- **A drug matrix** — a colour-coded landscape table of which clinical grades may give which medication, with a key to the column headings and an approval block. It has its own page, reached by the **Drug matrix** button in the top bar, and can be attached to a bag or register so that document carries it too.

Controlled drugs are held in the CD safe, not in a drug bag, so the two are kept completely apart, and a formulary is not a stock list at all, so it is a separate generator again. Each keeps its own details and its own list, and you can prepare all of them in one sitting without them mixing.

Everything runs in your browser. Nothing is uploaded, nothing is sent anywhere, and it works with no internet connection once the page is open.

2. Getting started

Open the Ambulance Tools home page and choose **Drug Bag Tracker**, or open `drug-bag-tracker/index.html` directly. There is nothing to install and no account to create. Start with the **Company Profile** on the home page: enter your company once, and this tool fills its company details in from it.

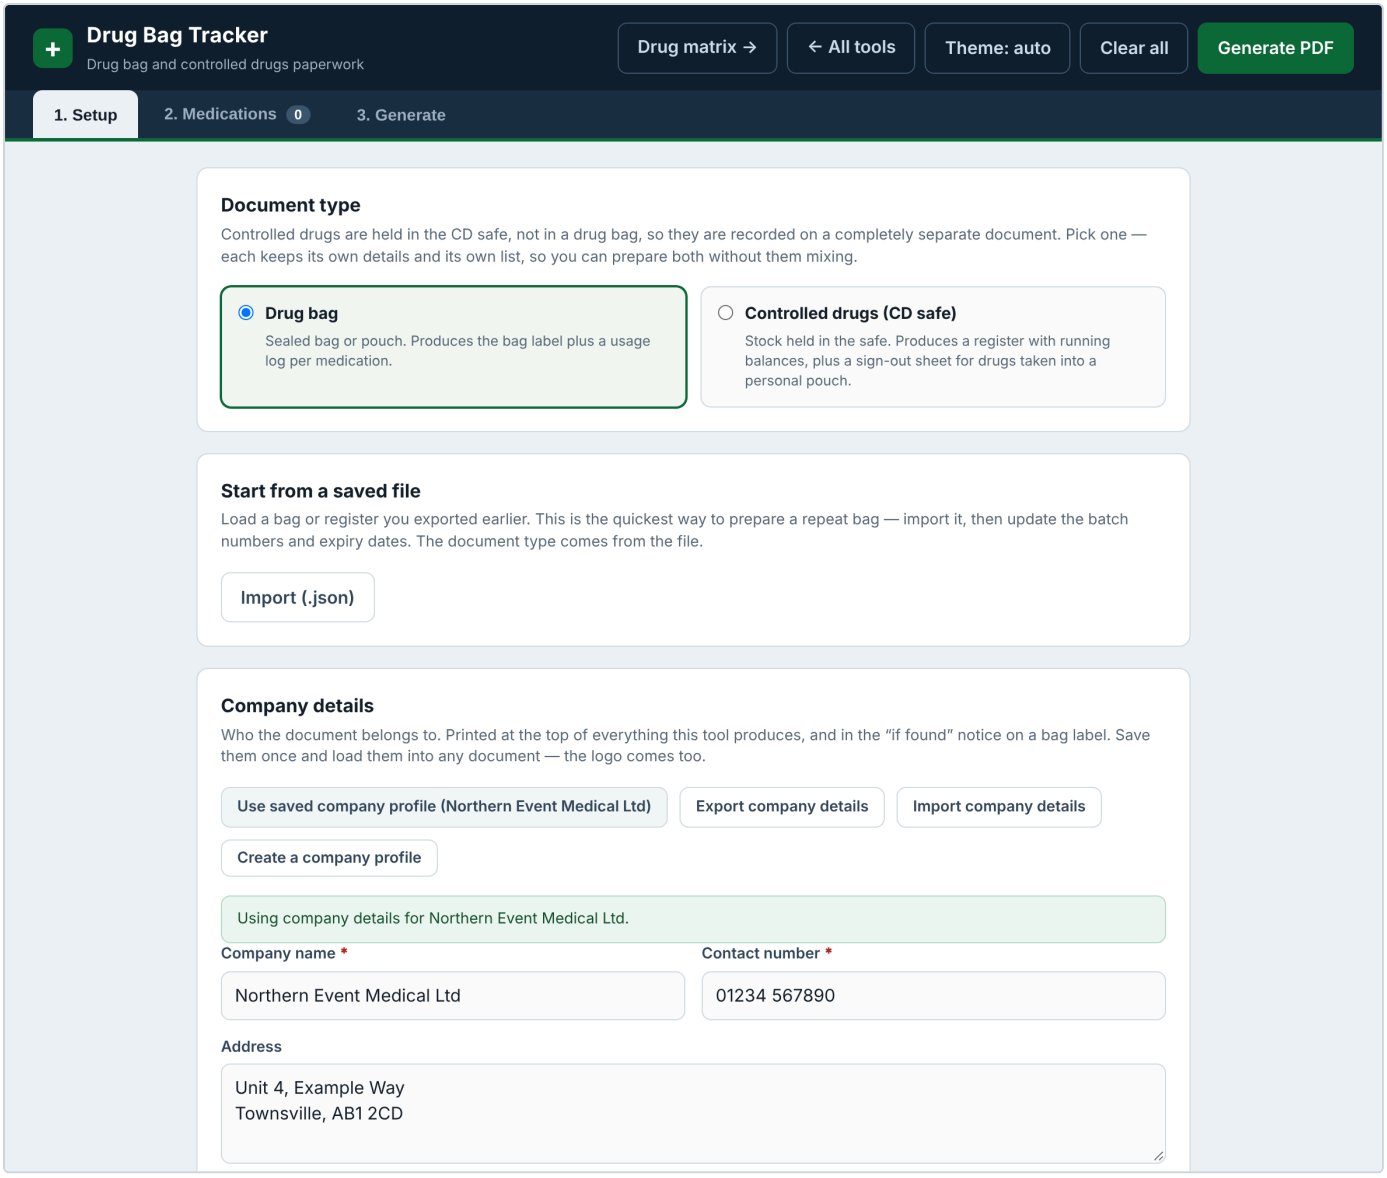

The top bar. **Drug matrix** opens the other generator, and the button there brings you back; **All tools** goes to the home page.

There are two generators, each with its own page, its own saved work and its own top-bar button to reach the other. **Drug Bag Tracker** makes the bag and CD paperwork; **Drug matrix** (section 8) makes the formulary. Both work the same way: left to right across three tabs.

1. **Setup** — who you are and which bag or safe this is.
2. **Medications** — what is in it.
3. **Generate** — download the PDF.

> **Your work is saved as you type**, in this browser, on this device. It is not a backup: clearing site data, a private window, or a different computer will not have it. Section 10 covers keeping a copy properly.

3. Setup

The setup tab, filled in for a drug bag.

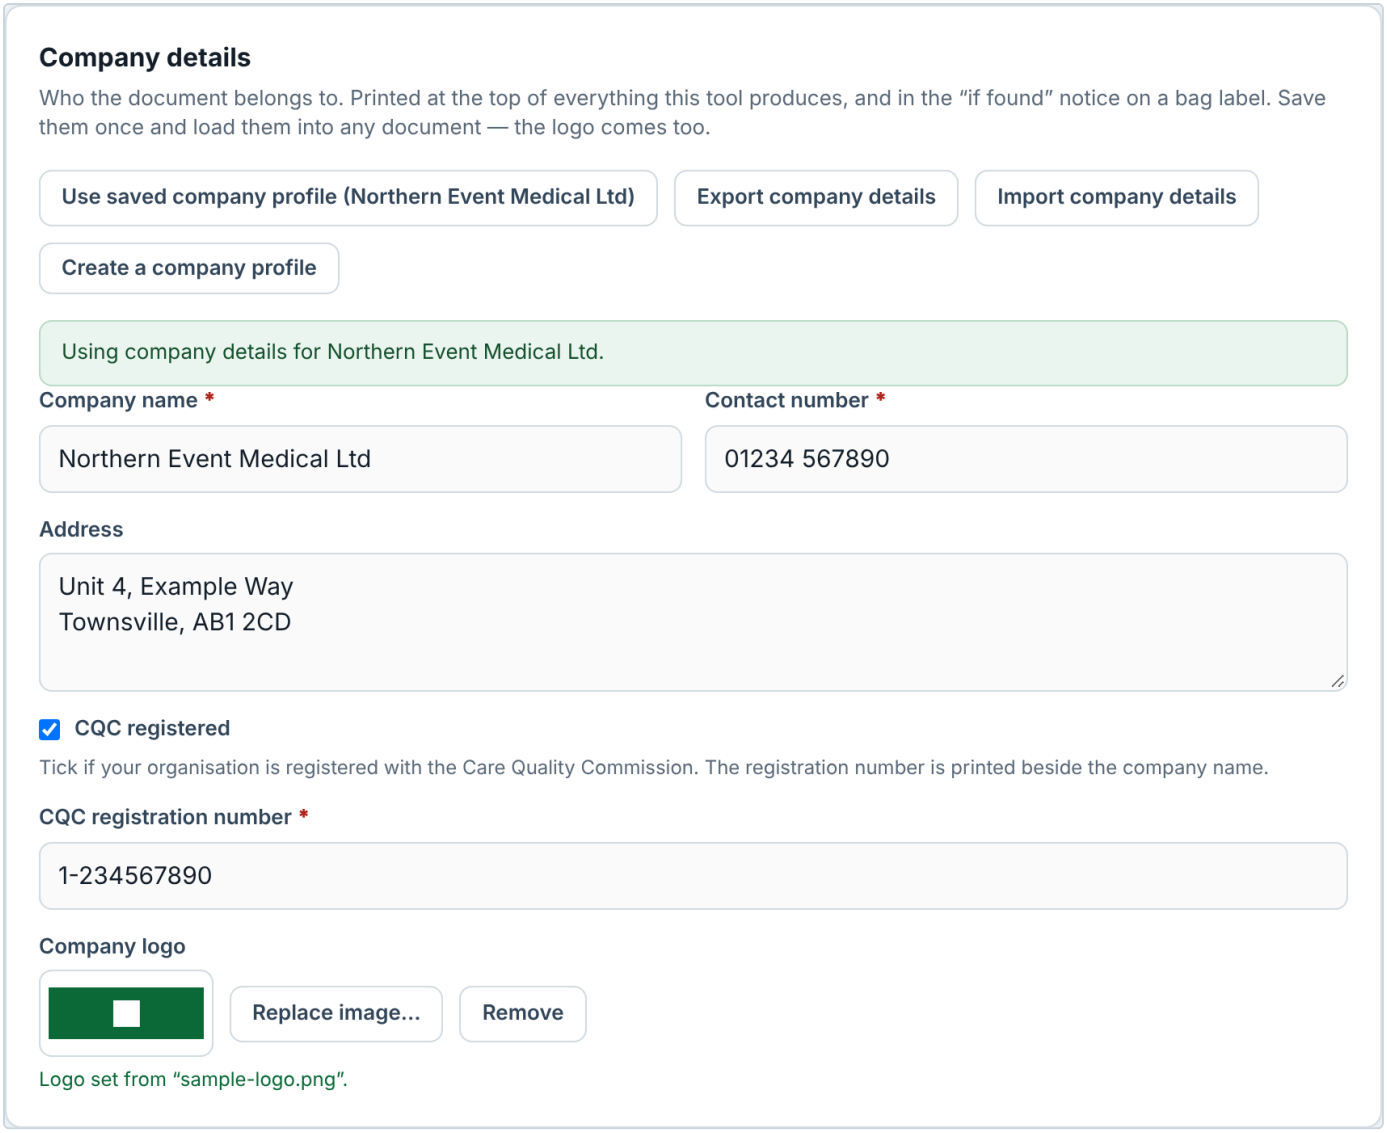

Document type

Pick **Drug bag** or **Controlled drugs (CD safe)** first — it changes the rest of the form and the document you get at the end. Switching between them does not disturb the other one, so you can prepare both in one sitting. The whole interface turns dark red on the CD side so you can tell at a glance which you are editing.

Start from a saved file

If you exported a bag or register before, load it here and update the batch numbers and expiry dates. That is much the quickest way to prepare a repeat bag. The document type comes from the file, so importing a register while you are on the bag side switches you over. Drop a saved formulary here instead and it is attached to the open document rather than replacing it — section 8 covers that.

Company details

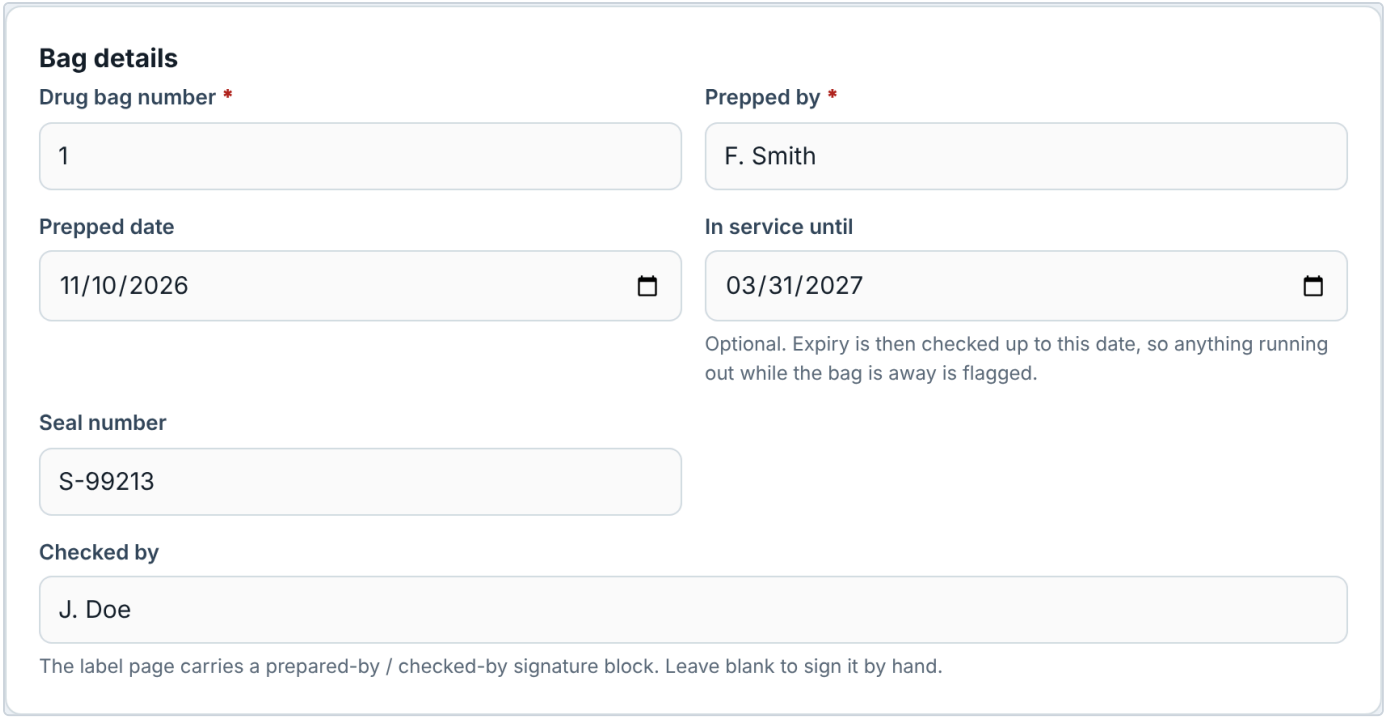

Company details, with the CQC toggle and the logo.

Name, contact number and address appear on the label and in the "if found" notice. They are the same on every bag you ever make, so keep them in a **Company Profile** (on the home page) and click **Use saved company profile** to fill them in, logo and CQC registration included. On another device, **Import company details** loads the profile's file instead. **Export company details** saves them from here as the same kind of file, which carries nothing about any particular bag.

CQC registered is a toggle, because not every organisation is registered. Tick it and a registration number is asked for; that number is then printed beside your company name on the label and register front sheet. Leave it off and nothing about CQC appears anywhere.

Company logo takes a PNG or JPEG, drawn at the top of the label on a white panel so a dark logo still reads. It is scaled down before being stored and travels with your exports.

Bag or safe details

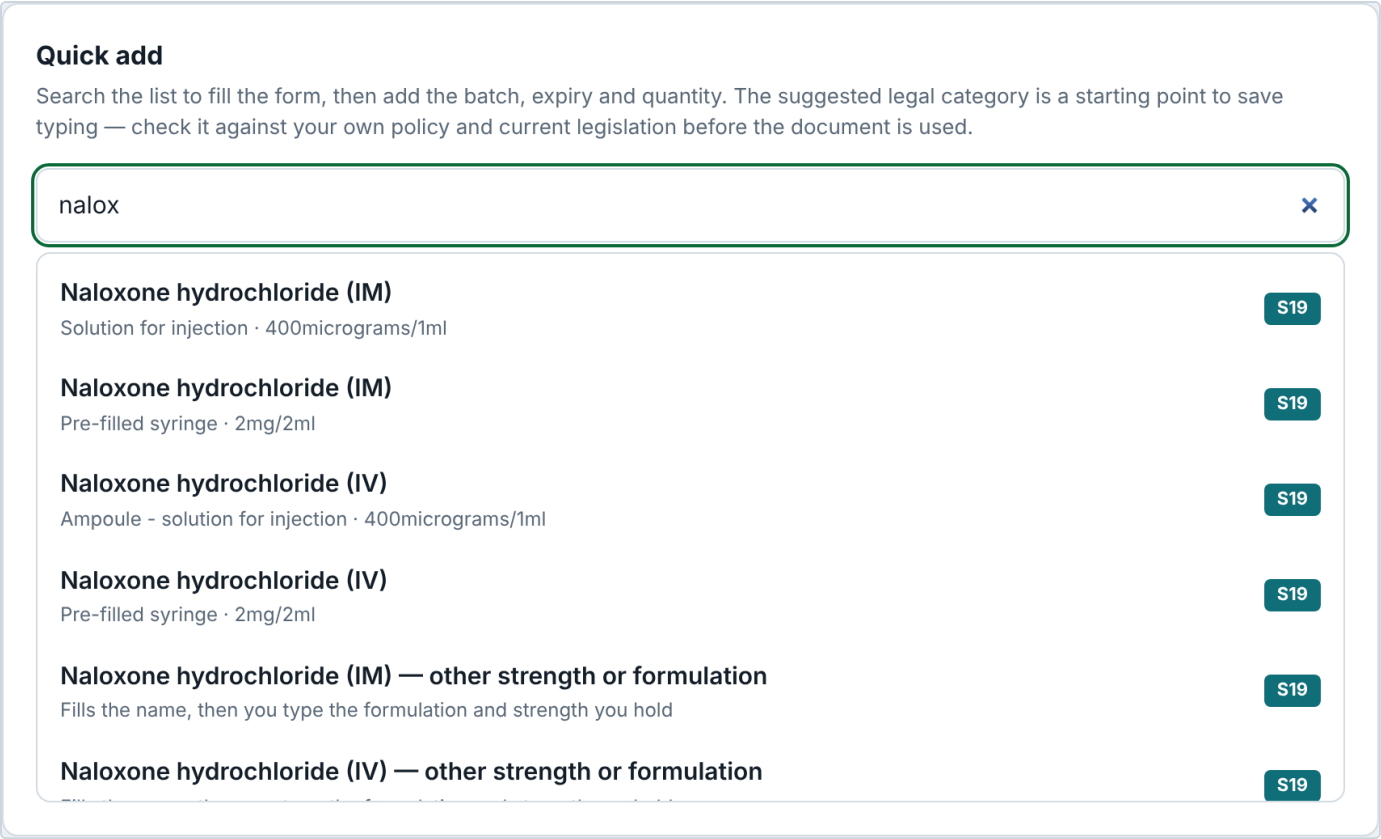

Bag details. On a CD register these read safe reference, location and accountable officer instead.

In service until is worth understanding. Left blank, expiry is judged against today. Set it to the date the bag is due back and expiry is judged against *that* instead — so stock that is in date now but runs out while the bag is away gets flagged, in the app and in a band on the label. It is the difference between “is this in date?” and “will it still be in date when this comes back?”

4. Adding medications

Quick add

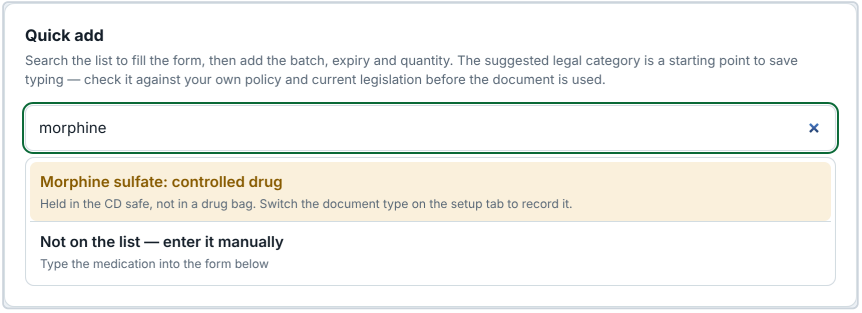

Searching the built-in list. Matching works across name, formulation and strength together, so “nalox 2mg” and “parac susp” both find what you meant.

Pick an entry and it fills the name, formulation, strength and a suggested legal category, leaving you the batch, expiry and quantity. Everything stays editable afterwards.

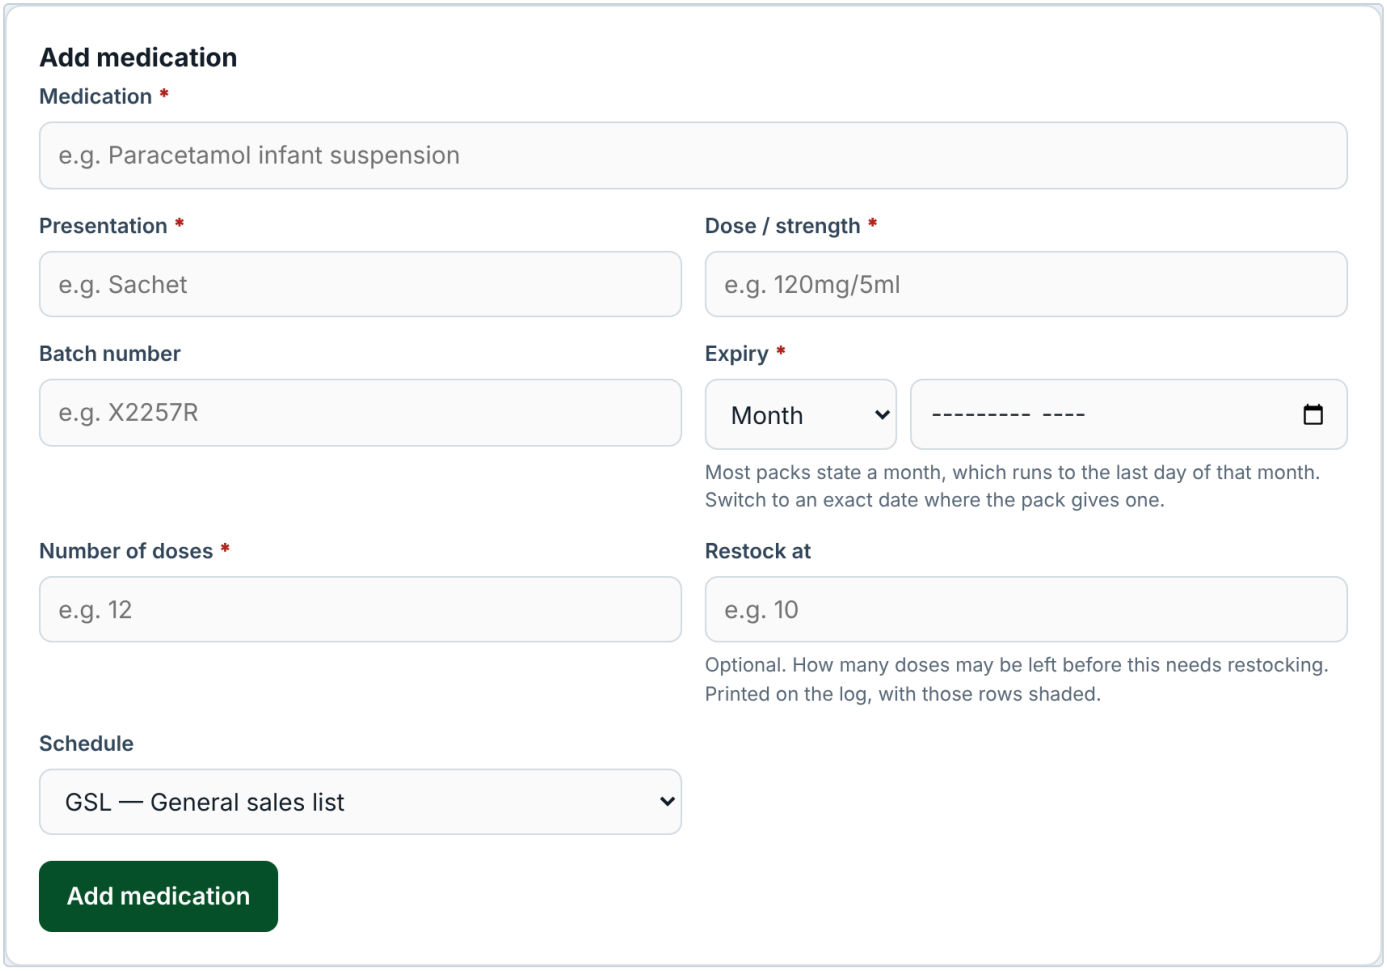

Two options are always offered at the bottom of the list:

- **— other strength or formulation** fills only the name, for when you hold a different presentation from the one listed.
- **Not on the list — enter it manually** clears the form so you can type anything at all. The list is a shortcut, never a restriction.

Controlled drugs are not offered on a drug bag. Searching for one tells you where it belongs instead.

The form

Batch, expiry and quantity are what you add after picking an entry.

Expiry

Most packs state a month, so the field is a month picker by default and treats the stock as in date to the last day of that month. Switch it to **Exact date** for packs that print a full one. The line underneath confirms how it was read before you add anything.

Quantity

The number of doses in the bag — that is how many numbered rows the usage log gets. On a CD register this is the quantity held, and you also give a **unit** (ampoules, ml, mg…) which is printed in the register's balance columns so a figure can never be read as the wrong measure.

Restock at

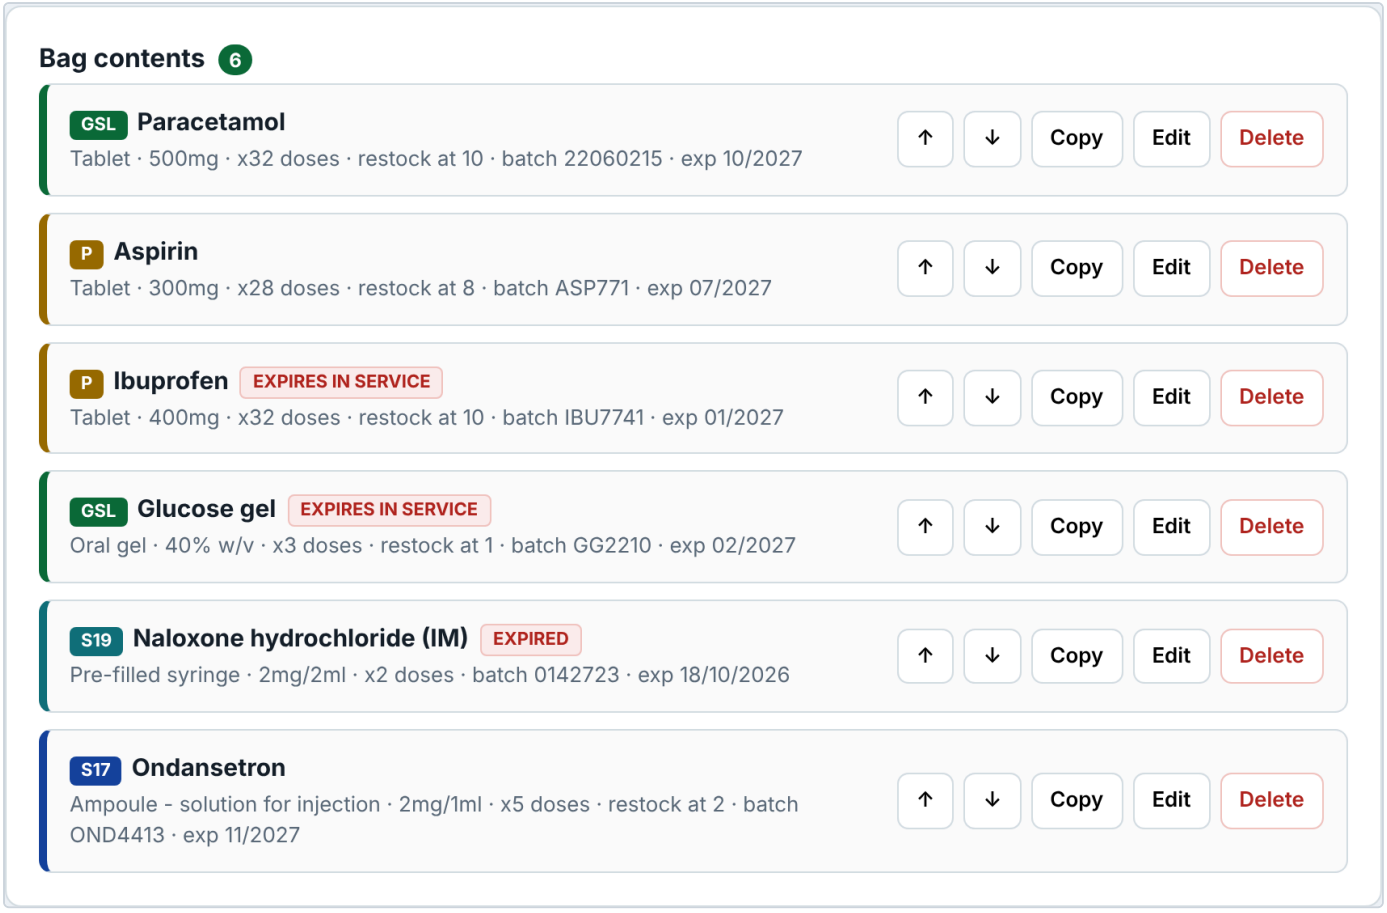

Optional, and worth setting. A box of 30 paracetamol holds 30 doses, but you would not run it to nothing — put **10** here and the log shades every row from the point where 10 doses are left, so signing into a shaded row is the signal to replace it. It must be below the quantity held; a level equal to it would mean restocking the bag the day it was packed, and is refused.

On a CD register the same field reads **Reorder at**, and is printed on the front sheet and at the top of each register page. Balances there are written by hand, so nothing is shaded — the level is stated for whoever is counting.

More than one batch of the same drug

Add it twice. Use the **Copy** button on an entry to prefill a new one with the name, formulation, strength and restock level, then type the second batch, expiry and quantity. Each batch gets its own log page — and for a controlled drug its own running balance, which is what you want, since one balance cannot span two batches.

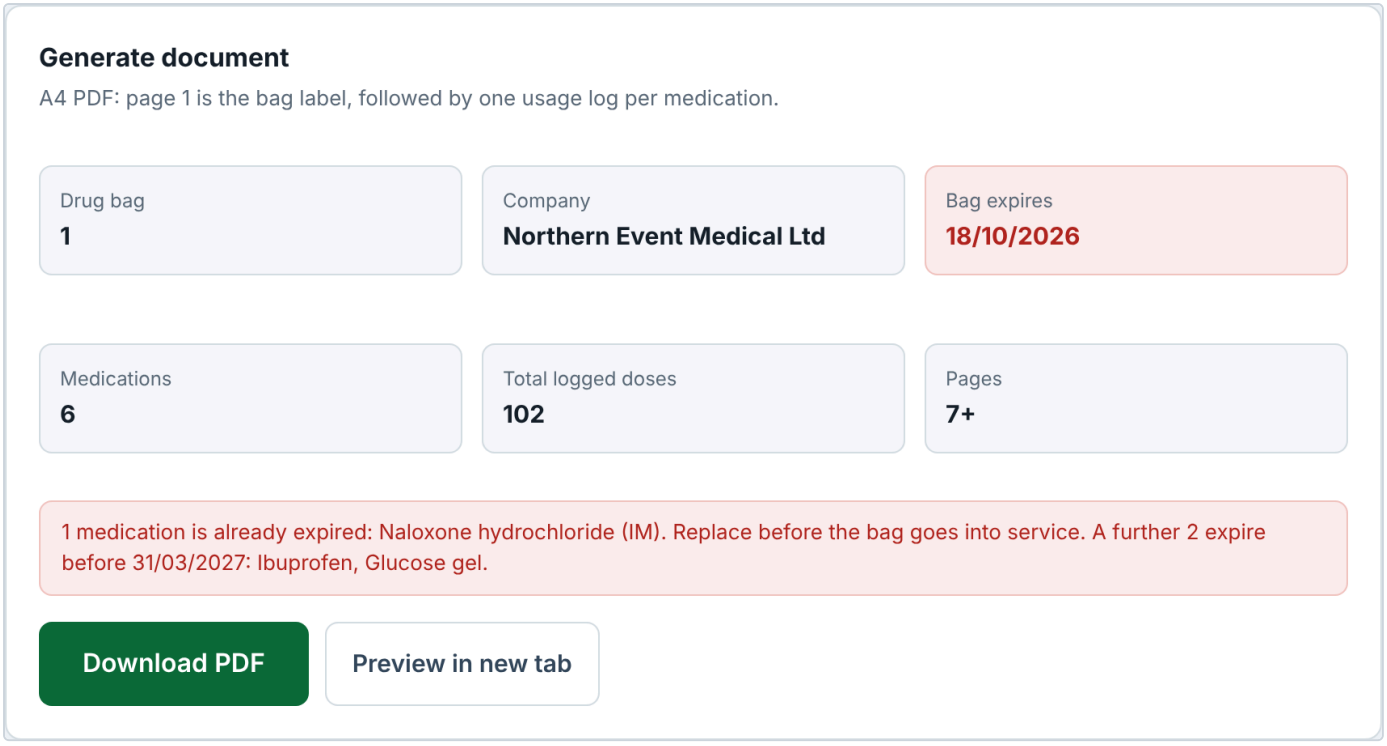

The list

Category, expiry flags and batch labels at a glance. Reorder with the arrows; the order carries through to the printed document.

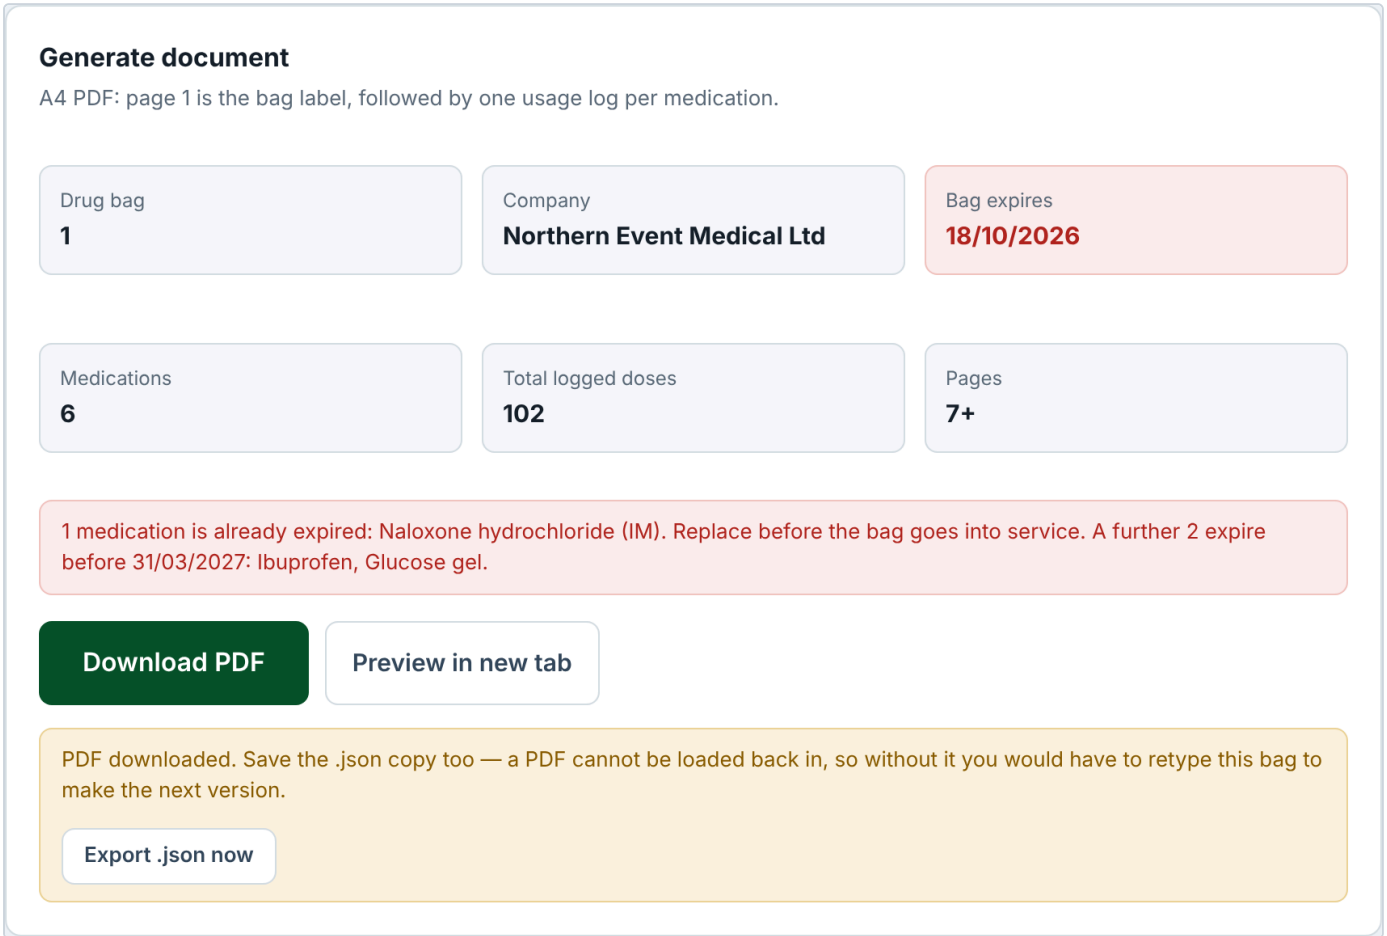

Red flags mean already expired, or expiring before the bag is due back. Amber means within 90 days. Both appear again on the generate tab and on the label itself.

5. Generating the document

A summary of what you are about to print, with any expiry warnings.

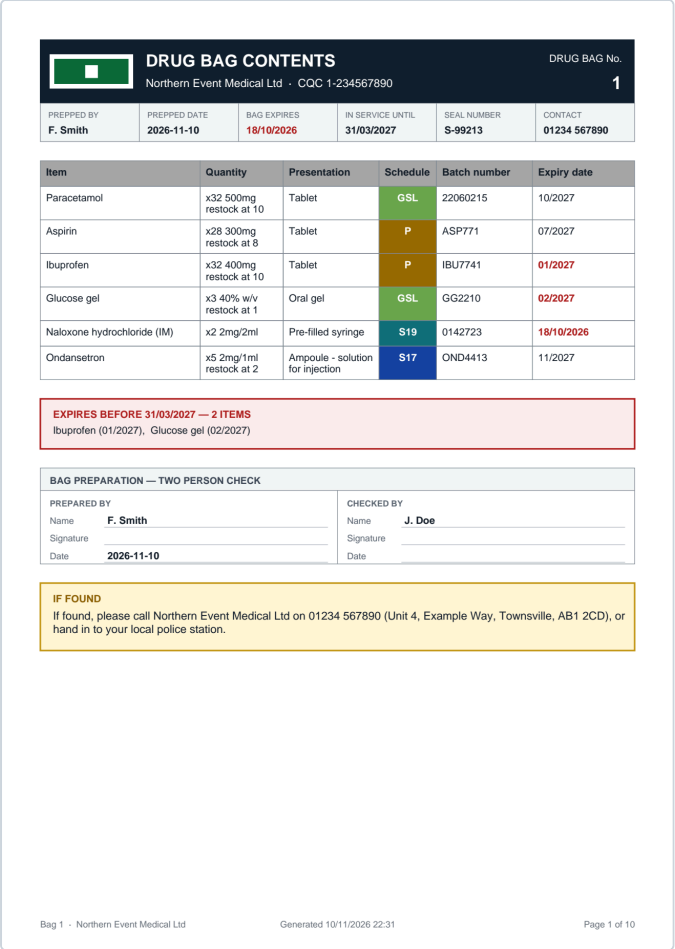

Download PDF saves the document; **Preview in new tab** opens it without saving. If anything required is missing, you are told what before anything is produced.

After downloading, a reminder to save the .json too.

The PDF cannot be loaded back in. It is the printable record. The `.json` is the editable one — without it, next month's version of this bag has to be typed from scratch. Save both.

A usage log, one per medication.

The label carries your logo, company name and CQC registration, the bag number, who prepped and checked it, the prepped date, the seal number, and the **bag expiry** — the earliest expiry it contains, because that is when the bag as a whole stops being usable. The contents table colour-codes each legal category and shows anything expired or expiring in red.

Below it, a **two-person check** block to sign, and the **if found** notice asking a finder to call you or hand the bag to a police station.

If anything expires before the in-service date, a red band lists exactly what and when.

Each usage log repeats the medication, presentation, dose, batch and expiry at the top, then gives one numbered row per dose with date used, PRF number and a signature. A **doses left** column is printed down the side, so the last signature tells you what is in the bag without counting rows. A medication with more doses than fit on a page is split evenly across pages rather than leaving a stub.

Paracetamol (continued)

Bag 1 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 3 of 10

Paracetamol, restocked at 10 doses: the shading starts where 10 are left.

Where a **restock level** is set, the log says so under the title and shades every row from that point down — sign into a shaded row and that medication needs replacing. The shading and its note are repeated on any continuation sheet, so a page on its own still makes sense. The quantity on the label carries the level too.

Every page footer carries the bag, the company, when the PDF was generated, and “Page 3 of 9” — so a missing sheet is obvious and you can tell two printouts apart.

7. What the CD register contains

The CD side of the tool, in its own colour.

STORAGE AND HANDLING
Controlled drugs are held in the CD safe and are not carried in the drug bag. Stock is signed out of the safe into a personal drug pouch on the sign-out sheet at the back of this register, and any unused stock is signed back in. Retain this register in line with your organisation's controlled drugs policy and current legislation.

CD safe 2 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 1 of 6

The front sheet.

Morphine sulfate — batch MOR2291

PRESENTATION	Amp	DOSE	10mg/1ml	BATCH NO	MOR2291	EXPIRY	12/2027	REORDER AT	3 ampo

Every entry must be signed by the administering clinician and a witness. Record any discarded volume on its own line and carry the balance forward.

BALANCE BROUGHT FORWARD — 10 ampoules (stock entered 2026-11-10)			—	—	**10**	A. Jones	B. Patel

CD safe 2 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 2 of 6

A register page, one per batch.

The front sheet lists the safe reference and location, the accountable officer, the stock held with quantities and units, a two-person stock check block, and a storage and handling notice.

Each register page opens with the balance brought forward, then takes date, time, PRF number, amount given, amount discarded, running balance, and separate administering and witness signatures. Spare rows beyond the stock count give discards and part doses a line of their own.

CD SAFE — STOCK CHECK RECORD

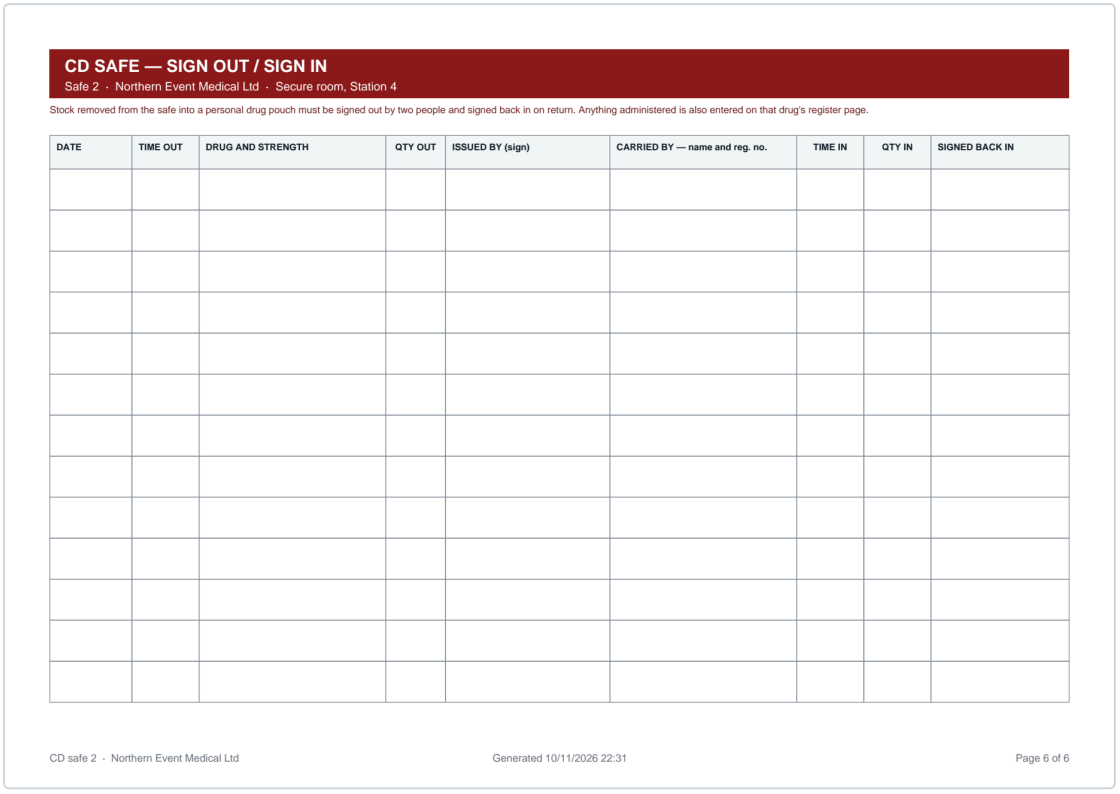

Safe 2 · Northern Event Medical Ltd · Secure room, Station 4

Enter the balance counted for each drug. Any discrepancy must be reported immediately in line with your controlled drugs policy and recorded on the drug's register page.

DATE	TIME	Morphine sulfate (ampoules) — MOR2291	Morphine sulfate (ampoules) — MOR3310	Midazolam (ampoules) — MZ4410	CHECKED BY	WITNESSED BY

CD safe 2 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 5 of 6

The stock check record — a column per drug, headed with its unit and batch, and the issued quantity on the first row to check against.

CD SAFE — SIGN OUT / SIGN IN

Safe 2 · Northern Event Medical Ltd · Secure room, Station 4

Stock removed from the safe into a personal drug pouch must be signed out by two people and signed back in on return. Anything administered is also entered on that drug's register page.

DATE	TIME OUT	DRUG AND STRENGTH	QTY OUT	ISSUED BY (sign)	CARRIED BY — name and reg. no.	TIME IN	QTY IN	SIGNED BACK IN

CD safe 2 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 6 of 6

The sign-out sheet — safe to personal pouch, and back again.

Both are landscape. The stock check record continues onto further sheets past seven drugs rather than squeezing the columns.

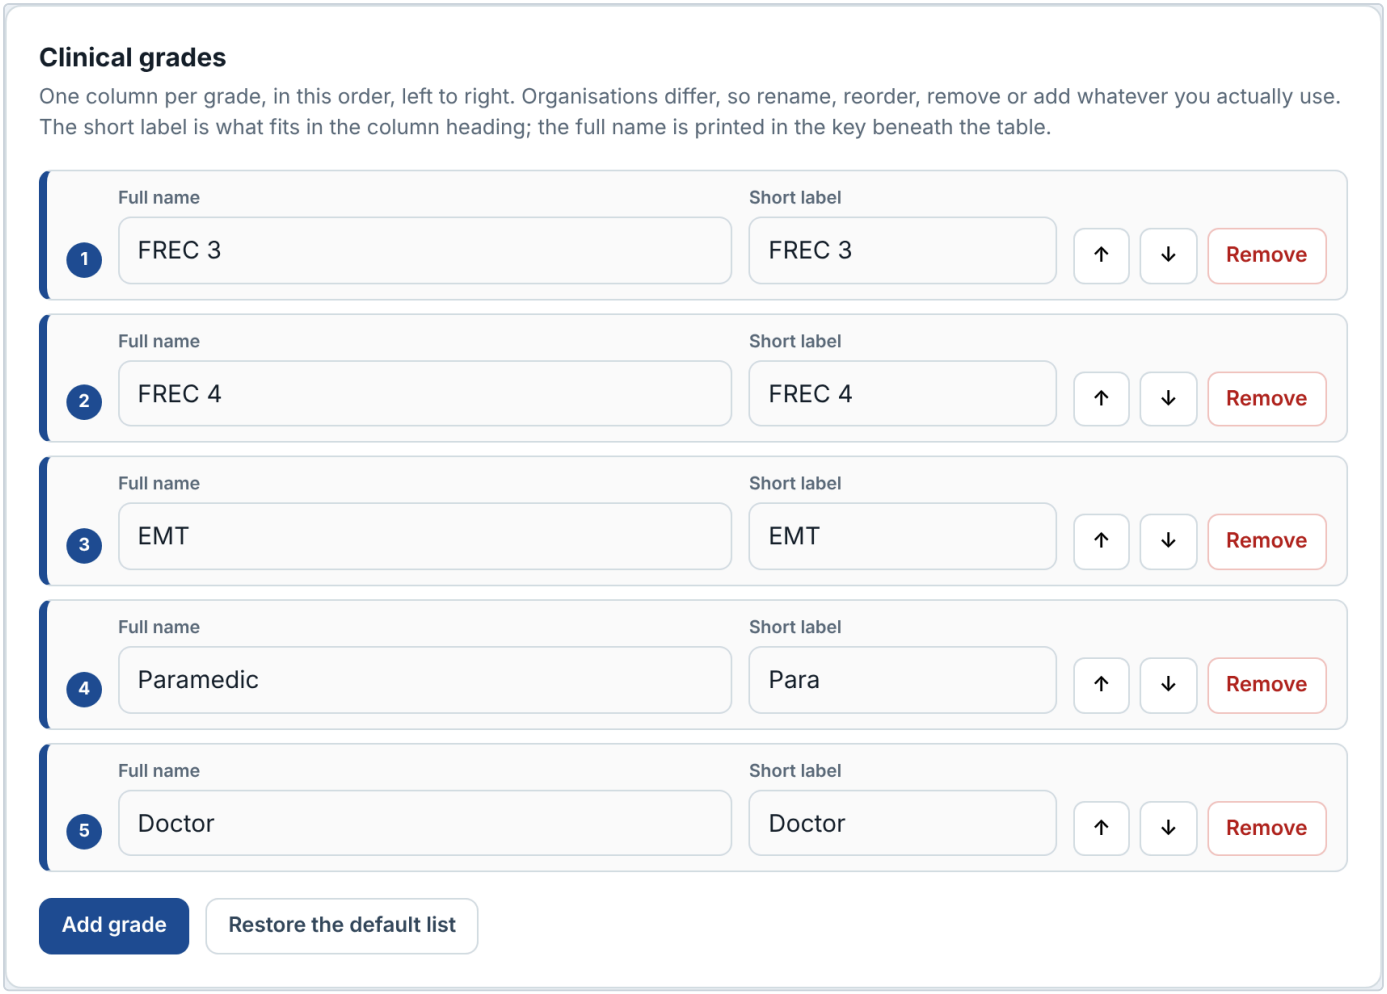

The register is a convenience format. It does not constitute, replace or discharge any statutory record-keeping duty. Satisfy yourself that it meets the requirements that apply to you before relying on it, and retain records in line with your own controlled drugs policy and current legislation.

8. The drug matrix

A drug matrix — a formulary — sets out which clinical grades may give which medication. It records no batches, expiry dates or quantities, because it describes what is allowed rather than what is held. That is why it is a separate generator, on its own page: press **Drug matrix** in the top bar to open it, and ← **Drug bag paperwork** to come back. Each keeps its own saved work, so neither disturbs the other.

It works like the bag side — details, then medications, then the PDF. What differs is below.

Your clinical grades

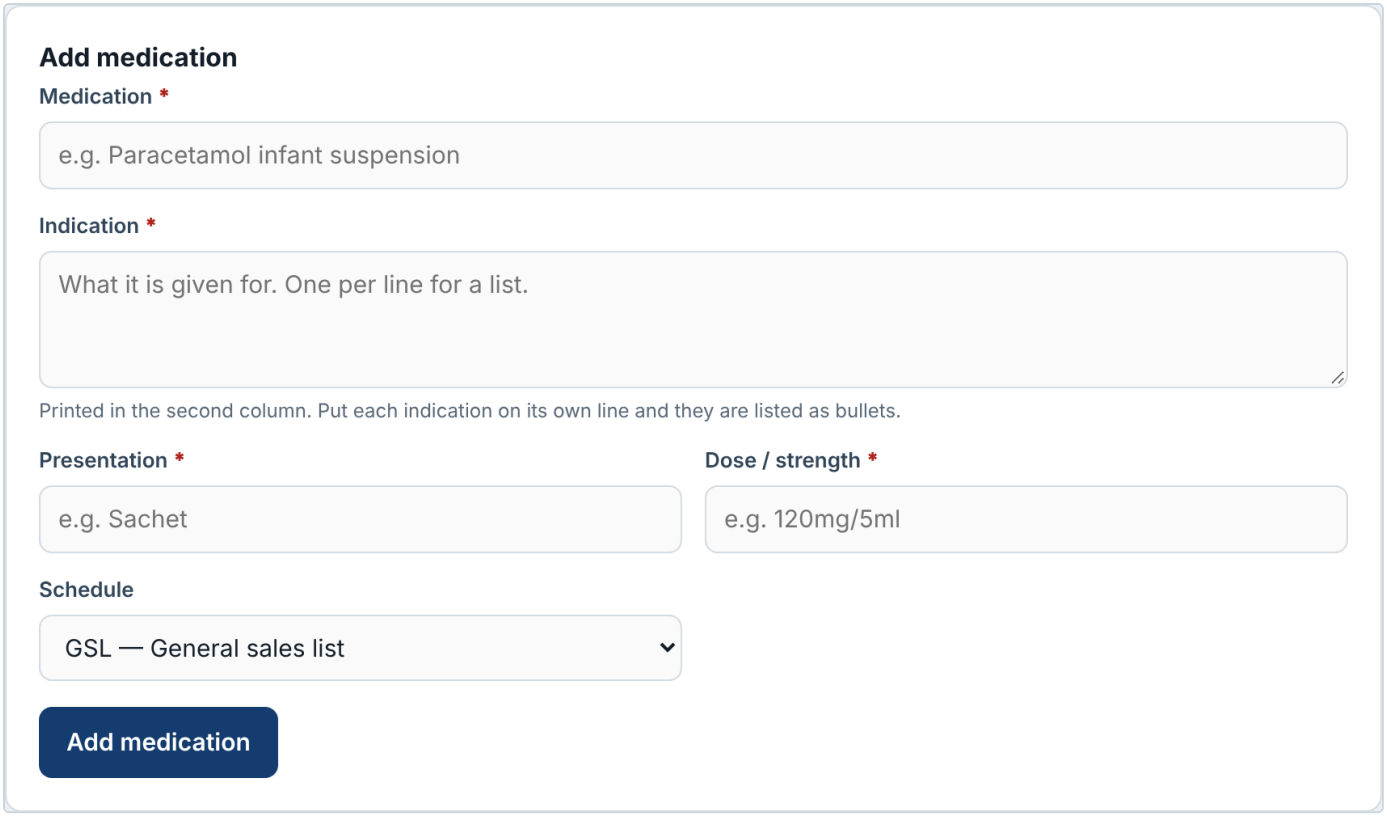

The clinical grades card, cut down to the five grades this example organisation actually uses.

The list starts with a common set — first responder, FREC 3, emergency care assistant, FREC 4, AAP, EMT, FREUC 5, paramedic, APP, nurse, doctor — but organisations differ, so it is only a starting point, and most will not use all eleven. **Rename** any grade, **reorder** them with the arrows, **remove** the ones you do not use, and **Add grade** for the ones you do. **Restore the default list** puts the original set back. The example through the rest of this section has been cut to five: FREC 3, FREC 4, EMT, paramedic and doctor.

Each grade has a full name and a short label. The short label is what fits in the column heading; the full name is printed in the key underneath the table, so an abbreviation never has to be guessed at.

Order matters. The grades appear left to right in the order you list them, so putting them in order of scope of practice is what makes the “this grade and above” fill below do something sensible. Removing a grade also clears everything ticked against it, and you are asked to confirm first.

Adding the medications

The medication form on the matrix side: an indication instead of batch, expiry and quantity.

Quick add works exactly as it does elsewhere, filling in the name, formulation, strength and suggested legal category. Anything not in the catalogue — oxygen, in the example opposite — is typed in by hand, as it is on the bag side. In place of the batch, expiry and quantity you get an **Indication** box — what the medication is given for. Put each indication on its own line and it prints as a bulleted list in the table.

Ticking who can give what

The grid. Green is allowed, red is not. Here FREC 3 carries oxygen and nothing else, and each row above it starts one grade further along.

Click any cell to change it. Rather than clicking every cell one at a time, use the fill modes above the grid:

- **Toggle one** — a click flips that single cell.
- **This grade and above** — a click allows that grade and everything to its right, and clears everything to its left. This is the quick way to say “paramedic and up”.
- **This grade and below** — the same in the other direction.

Clicking a **medication name** fills or clears its whole row, and clicking a **grade heading** fills or clears that whole column. A drug everyone carries is therefore one click, not one per grade.

Drug matrix 2026-v1 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 1 of 1

The generated matrix, A4 landscape.

Medication name, indication, formulation and strength run down the left, then one column per grade, green for allowed and red for not. Underneath sit the **key to the columns** and a **formulary approval** block for the approver and checker to sign and date.

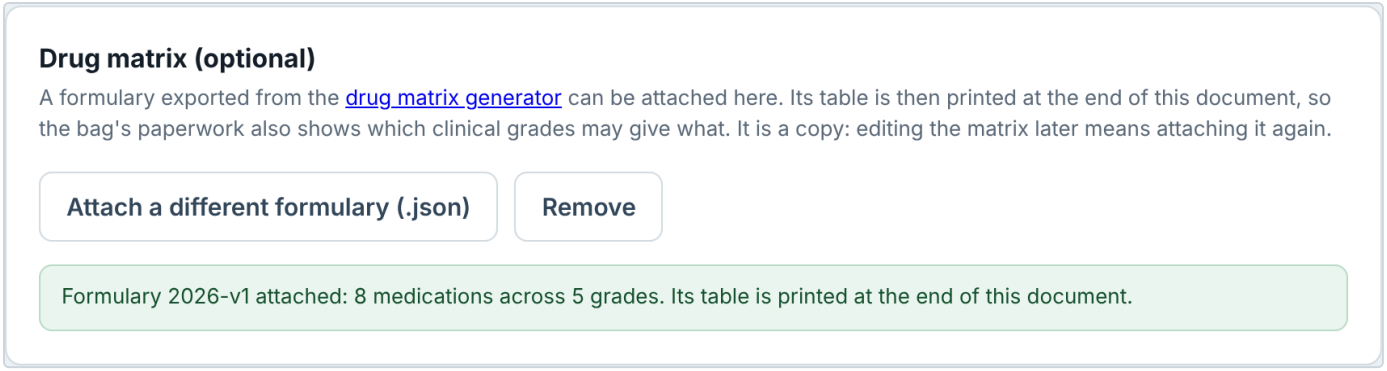

The banner carries your formulary reference, the approval date and the review date, so an out-of-date copy on a wall is obvious. If you have more grades than fit across one sheet, the table continues onto further sheets with the medication columns repeated and the banner saying which grades are on which sheet — for example “Grades 1–15 of 24”.

A matrix is a local governance document. What any individual may administer depends on their registration, their scope of practice, their employer's policy, any patient group direction or written instruction in force, and current legislation. This tool prints what you tick. Have the matrix approved by whoever is clinically accountable in your organisation before it is used.

Attaching a matrix to a drug bag

A formulary on its own answers “who may give what”. Attached to a bag or register, it answers that alongside “what is in the bag”, in one document.

1. In the matrix generator, **Export (.json)** on the Generate tab.
2. On the drug bag side, open **Setup** and use **Attach a formulary (.json)** on the **Drug matrix (optional)** card. Importing a formulary through the ordinary **Import** button does the same thing, rather than replacing the bag you have open.

The attached formulary, on the setup tab.

What is attached is a **copy**, taken at the moment you attach it. Change the formulary afterwards and the bag still carries the old one until you export and attach it again — usually what you want, since a bag that has gone out was prepared against a particular version. The bag's own .json carries the copy too, so importing that bag next time brings the matrix back with it. **Remove** takes it off again and leaves the formulary itself untouched.

Bag 1 · Northern Event Medical Ltd Generated 10/11/2026 22:31 Page 11 of 11

With a matrix attached, the bag's PDF ends with it — wearing the bag's company details and logo, but keeping the formulary's own reference, approval names and dates.

It is still one document. The matrix sheets are numbered as part of the bag's paperwork and carry the same footer, so a printed bundle cannot be split up by accident.

9. Legal categories

Category	Meaning
GSL	General sales list
P	Pharmacy only
POM	Prescription only medicine
S17	Paramedic exemption — Human Medicines Regulations 2012, Schedule 17
S19	Parenteral administration in an emergency — Schedule 19
CD	Controlled drug — recorded on the CD register, never in a drug bag

These are suggestions to save typing, not legal determinations.

Medicines can sit in more than one category depending on indication, route and pack size. Legislation is amended over time and the built-in list is a fixed snapshot that does not update itself. The categories were **not verified against primary legislation** when the list was compiled.

Check every category against current legislation and your own organisation's medicines policy, patient group directions and standard operating procedures before a document is used. Change any of them in the form — nothing is locked.

10. Saving, reusing and backing up

The two file types

File	What it is for
`Drug-Bag-1-saved.json` `CD-Register-2-saved.json`	A whole bag or register — details and every medication. Import it to rebuild or update that document.
`Company-Your-Ltd.json`	Just your organisation: name, contact, address, CQC registration and logo. Made by the Company Profile or by **Export company details**; load it into anything new.

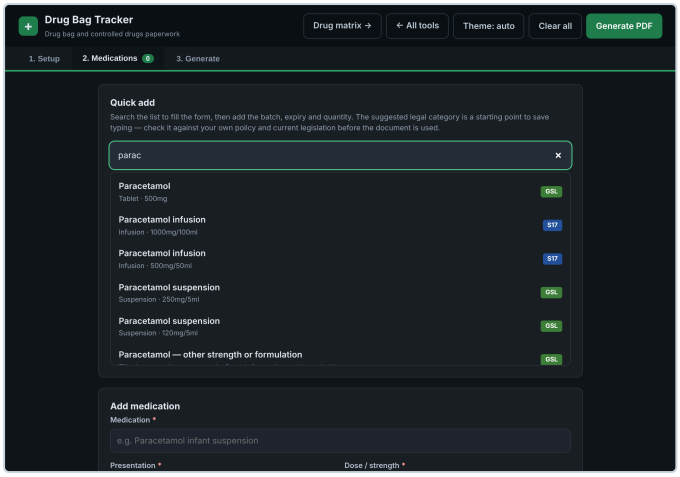

Importing a whole bag also works as a source of company details, so you can lift them out of any old export.

Preparing next month's bag

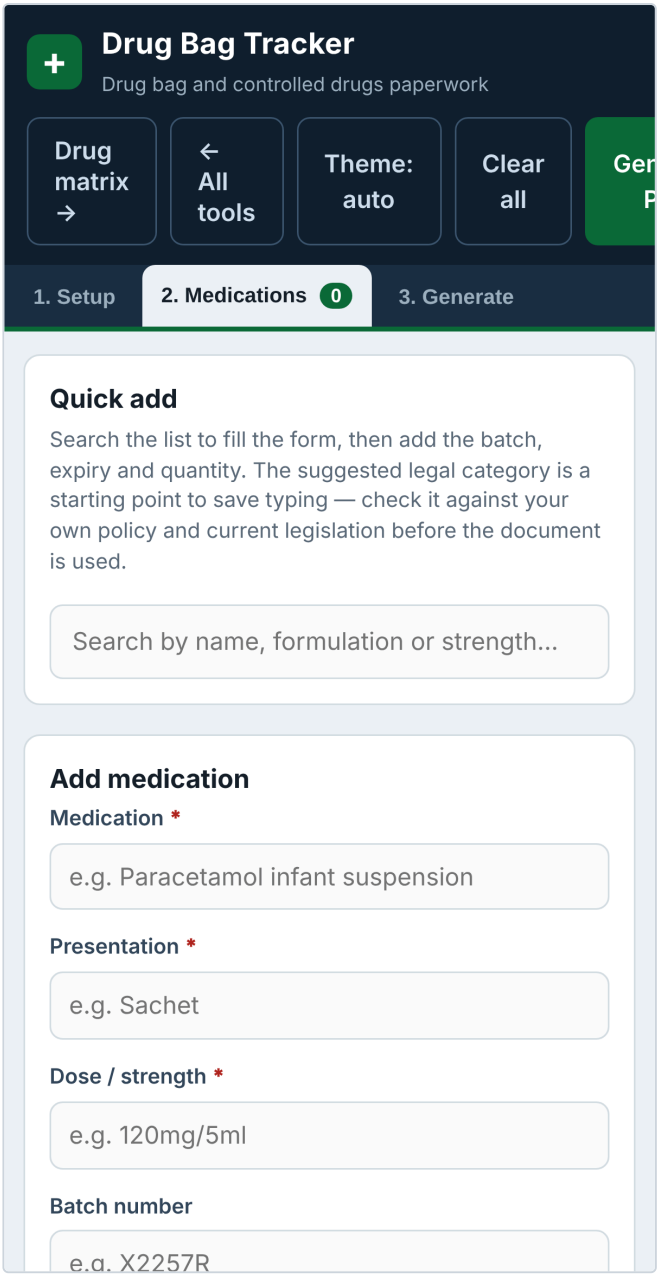

1. Setup → **Start from a saved file** → import last month's bag.
2. Update the batch numbers and expiry dates on the medications tab.
3. Generate, then export the `.json` again under the new bag number.

Browser storage is not a backup. Clearing site data, a private window, or moving to another computer will lose it, and no responsibility is accepted for work lost that way. Export the `.json` and keep it somewhere durable — the app tells you when a document has never been exported, or has changed since it was. **Back up everything** on the home page saves every tool's work in one file, and restores it on another device.

11. Dark mode, phones and offline

Dark mode.

On a phone.

The interface follows your device's light or dark setting. The **Theme** button in the top bar cycles auto, light and dark if you want to override it; your choice is remembered. The generated PDF is always light, because it is meant to be printed.

The layout collapses to a single column on a phone, so a bag can be prepped from a handset.

Once opened with a connection, the tools also work offline, and can be added to a phone's home screen like an app: in Chrome, **Install app**; on an iPhone, **Share** then **Add to Home Screen**. On an iPhone the home-screen app keeps its own saved work, separate from Safari, so use **Back up everything** to move it across.

12. Troubleshooting

“Complete the setup tab first”

Something required is empty. The message names each missing field. If you ticked CQC registered, the registration number is required too.

The expiry will not accept what I type

Expiry is picked, not typed. Use the month picker, or switch the dropdown beside it to **Exact date**. On Safari, which has no month picker, the field accepts typing instead — `07/25`, `10/2027` and `18/10/2025` all work.

My medication is not in the quick add list

Use **Not on the list — enter it manually** and type it. If it is a controlled drug, switch the document type to the CD register on the setup tab.

Preview does not open

Your browser blocked the pop-up, which is common on mobile. Use **Download PDF** instead.

My work has disappeared

Browser storage was cleared, or you are on a different device, browser, or a private window. Import your `.json` export. If you have none, it cannot be recovered.

The browser says it will not store my work

Storage is full or blocked. Export the `.json` immediately — what is on screen is still correct, but it will not survive closing the tab.

13. Disclaimer, licence and sources

Disclaimer

Drug Bag Tracker is a document generator, not a clinical, pharmaceutical or legal reference. It is provided **as is, without warranty of any kind**.

Before any document is used, check that every entry matches the stock actually held: medication name, formulation, strength, batch number, expiry date, quantity and legal category. The categories the tool offers and pre-fills are suggestions, not legal determinations, and were not verified against primary legislation.

The controlled drugs register is a convenience format and discharges no statutory record-keeping duty. Everything is stored in your browser and nothing is uploaded; browser storage is not a backup, and no responsibility is accepted for work lost to it being cleared.

Sources

The built-in medication list is a user-supplied list of common pre-hospital medicines. The legal category suggestions were informed by the Journal of Paramedic Practice article *Paramedics and medicines: legal considerations*, NHS Specialist Pharmacy Service guidance on legal mechanisms to supply and administer medicines, HCPC guidance on sale, supply and administration, and Schedules 17 and 19 of the Human Medicines Regulations 2012.

None of these is a substitute for the legislation itself, and the primary text was not reachable when the list was compiled, so the categories are unverified against it.
